Nucleic acid molecules, such as DNA and RNA, are the genetic material of living cells, and play critical roles in biological processes such as the replication and expression of genes. The nucleic acid molecules are typically surrounded by a protein matrix that protects them from the environment. Nucleic acid molecules, particularly DNA, are vulnerable to degradation by external agents. For example, DNA is often damaged by agents, such as ionizing radiation and many chemical compounds, which are present in the environment. In addition, in vivo, nucleic acid molecules are often damaged, at some stage in the lifetime of the cell, as a consequence of processes such as the replication of DNA, transcription of RNA, and protein

synthesis. Some nucleic acid molecules, such as DNA, are particularly sensitive to damage, and will be rapidly destroyed by external agents that cause degradation of the nucleic acid molecule. In addition, the attack by cellular nucleases on nascent DNA in the DNA replication
